TWIN TOWER
TRADE PLAN

UNLOCK ICT LOGO, MJH NAME AND IMP IN 1 GO

BY HOPIPLAKA

0.

PROLOGUE

“IF ONLY YOU WOULD KNOW THE MAGNIFICENCE OF THE 3, 6, AND 9, YOU WOULD HAVE A KEY TO THE UNIVERSE.”

NIKOLA TESLA

Dear Reader,

Thank you for downloading this book where I try to demystify some stuff ict (innercircletrader, Michael J Huddleston) put out there over the last 15+ years.

First and foremost, this is my interpretation to the concepts he put out there. You can consider it fiction, and by no means this book claims to explain enigma, or how the algorithms deliver price to the market.

I hope you still find it a great read, and might spark some interest in digging deeper in some of the concepts.

I will try to do my best to:

- explain what the logo ict is using might mean
- Where the name Michael J Huddleston originates from
- Give a reasonably explanation to the IMP node concept

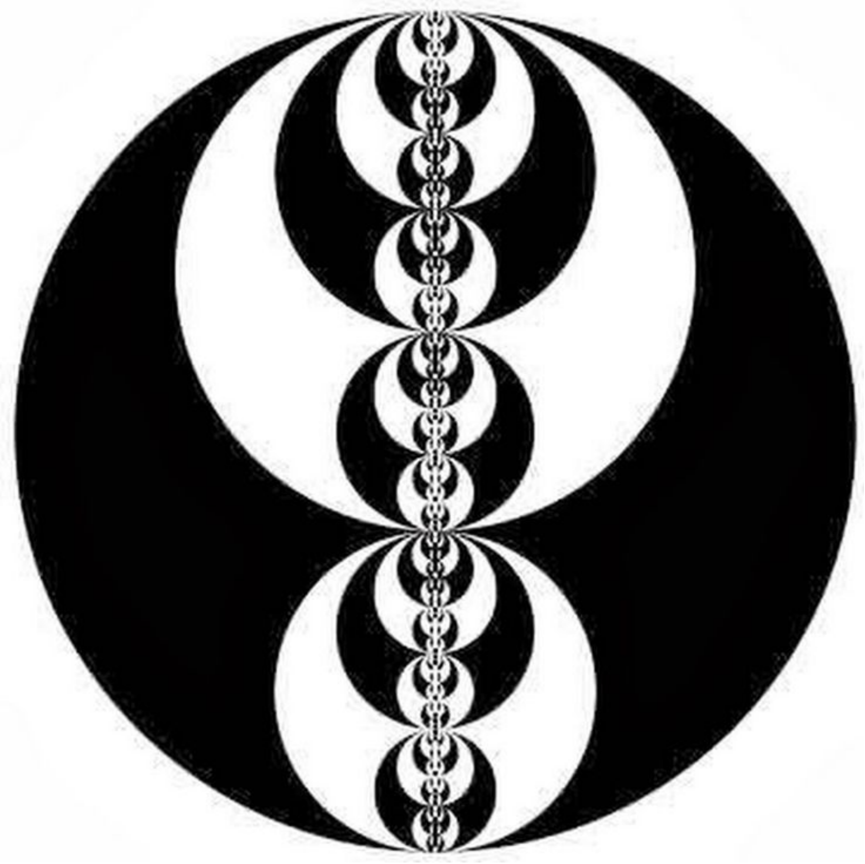
This trade plan is not using my other work on Goldbach and PO3, you can still download it from https://hopiplaka.com (https://hopiplaka.gumroad.com/l/goldbach_trading_without_discord)

Enjoy reading this small publication, if you find the content useful, please let me know on contact@hopiplaka.com or join the twin tower dedicated telegram channel https://t.me/hopiplaka_twintower

Hopi

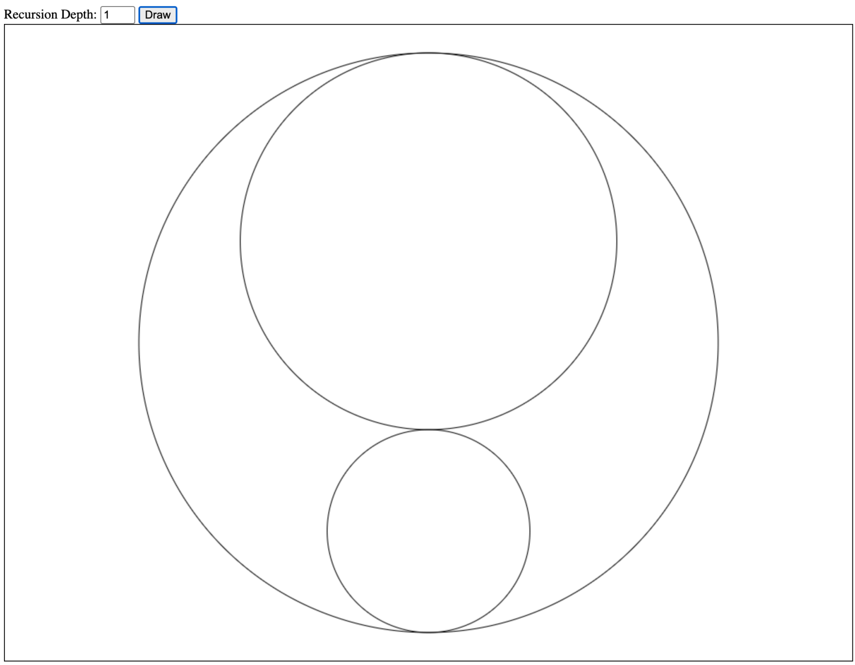
1.

ICT LOGO

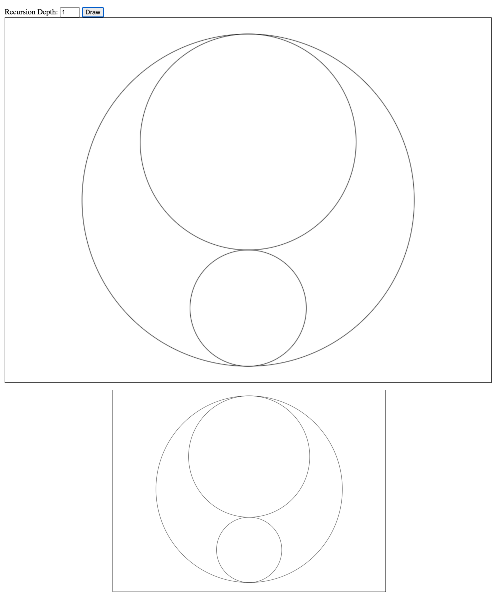


When you closely look at the logo ict is using since the last decade, you can clearly see it consists out of 3 circles, that repeat time and time again.

The base is a large circle, and 2 inner circles. One is smaller than the other.



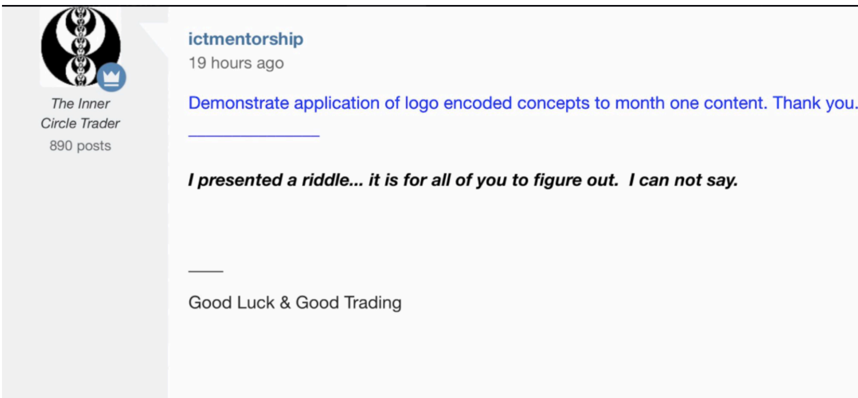
The pattern is repeated over and over again, and in the end you end up with ict's logo.



That's interesting and all, apart from his focus on power of 3, clearly referring to the number 3, what can this now mean you wonder?

In order to find the numbers that make up the circles, we need to delve deep into the other puzzles he shared.

After all, he admitted he presented the content as a riddle, and I like riddles.



2.

MICHAEL J HUDDLESTON

It is my believe that the truth of everything is hidden in the internet name ict uses, namely Michael J Huddleston.

It might just be a coincidence that his name resembles an interesting financial website.

On my twitter https://x.com/hopiplaka I give a clue what you had to do. Namely reorder all the letters of his name, and you will end up with a sentence that lead you to a website.

This website will lead you the explanation of almost all of ict's pd area names, and other stuff that he shared over the years, including cbdr (central bank dealing range), ar (asian range) and flout (find liquidity of uninformed traders).

As you will read in this book, the cbdr/ar/flout sequence will play a big part in unlocking the set of numbers and the sequence that will later make up the "twin tower" trade plan.

Old time followers of ict might know he said he knows the High and Low of the next trading day, before the day (or week) starts.
So that's also a major hint towards the website.

Without further ado - and I admire all the guesses that were send to me in order to crack it :) - I will just give it here:

CME (IL) JUST HAND HL EOD

So that's interesting. CME group - based in Illinois - is the entity responsible for all futures trading and more.
The website is https://cmegroup.com

And wait, do you say they hand out the H/L before the day starts?

Of course, they even publish the highs and lows on their website, each and every day.

https://www.cmegroup.com/trading/price-limits.html#equityIndex

Now this page is really interesting, because there's a reference to 3 different numbers. Let's dive into those.

3.

THE SET OF NUMBERS

If we read the website shared above, you can see 3 numbers.

The are called **circuit breakers**. Does this name ring a bell to anyone?

Rightly so, one of ict's pd areas is called breakers, a hint to this.

When you scroll through these pages, you can see there are circuit breakers for equities, forex, crypto and so on.

US Indices use 7, 13 and 20%, and 3.5% during the day
Crypto is using 10%
Forex is using 4%

It's the percentages that an asset is allowed during a day, before trading is halted. There's more to it, but you can read all info on the CME group website.

All great hopi, but where does this cbdr/ar/flout come into play here?
Good question, we need to get a different page from the website:

https://www.cmegroup.com/education/articles-and-reports/understanding-price-limits-and-circuit-breakers.html#circuit-breakers

And there's an interesting paragraph on this page:

TRADITIONAL CIRCUIT BREAKERS ARE A SERIES OF PRICE LIMITS ABOVE AND BELOW A REFERENCE PRICE (USUALLY SETTLEMENT) FOR CERTAIN CME GROUP PRODUCTS

Where did I read that before? With a little bit of creativity we end up with:

Circuit **B**reaker **D**aily **R**estrictions **a**re (a) **r**ange (of) **F**luctuation **L**imits **O**n top off (and) **U**nderneath (a) **T**hreshold
See where the cbdr/ar/flout come from? Another hint towards cme group.

In order to dive deeper, we need to have another set of ict acronyms.

Equilibrium
Mean **T**hreshold
Consequent **E**ncroachment

Like explained in the book of hopi on Goldbach, this is Einsteins formula e=mc2

This is exactly referring to the sentence above.

When you read on how the threshold is calculated, you will see they use the vwap price of the last 30 seconds before 1600 EST, or 1500 CT.
Note, for forex, crypto, gold, other settlement timings are in play, so it's good to read up on those.

In order to read up on the fixing prices, which is the threshold above, read this page, and check for each asset to rules:
https://www.cmegroup.com/markets/fixing-price.html?redirect=/trading/fixing-price.html#fx&tab_VZ7fiwi=equity-indices

Again, these are the high/lows of the next day.

Ict said: I know the high/low of the next day, but was he referring to the exact H/L, or just the maximum H/L, another word play. I leave it up to your imagination.

So now we now that the new **E**quilibrium for the next day, is the **mean threshold,** which is basically the fix price (mean is vwap, threshold is the price).

Next is we need to have C2.
C2 is exactly as it is described. A **C**ircuit breaker range, above and below.

So we need to have 2 circuit breaker ranges. And we understand these are either 7, 13 or 20. (The candle counting guy was pretty close ;))

So C2 stands for Circuit breaker dealing range, above and below the fix price.

7, 13 and 20. If one is reached, the next one will be in play. Until the new day starts. Than it will fall back to the 7% again.

Notice the pattern with ict here? Range expansion and contraction, another ict classic, but just based on circuit breakers.

Also understand why ict says TIME, than PRICE?
Without the correct time part (the settlement time, fix time), you will not find the price levels, based on vwap of the last 30 seconds.

You will also see that sometimes, there is no fix price, because the market is closed early (for a holiday, ...).
When this is the case, they will use the fix price of the previous trading day.

This is what ict want to communicate with **time distortion**. It's not the previous settlement price, but the one of the day or days prior.

Also good to know that on some markets, circuit breakers are called volatility interrupt, or v.i., might be a reference towards volume imbalance of ict.

For an overview of how the fix prices are calculated, check out following link:
https://cmegroupclientsite.atlassian.net/wiki/spaces/EPICSANDBOX/pages/457215555/CME+Group+Settlements

4.

THE SEQUENCE

So now we have the set of numbers, namely 7, 13 and 20 for the normal us indices (forex, crypto are different).

Why about the sequence, and where do IMP nodes come into play here?

We still need to C2 dealing range, and this is where we reveal the sequence.

Let’s try a bass range. At the time of writing this was the fix price:

https://www.cmegroup.com/markets/fixing-price.html?redirect=/trading/fixing-price.html#fx&tab_VZ7fiwi=equity-indices

E-mini Nasdaq-100	4 PM NYC	NQ	September 2025	23224.21	18 Jul 2025

The upper and lower prices can be found here:
https://www.cmegroup.com/trading/price-limits.html#equityIndex

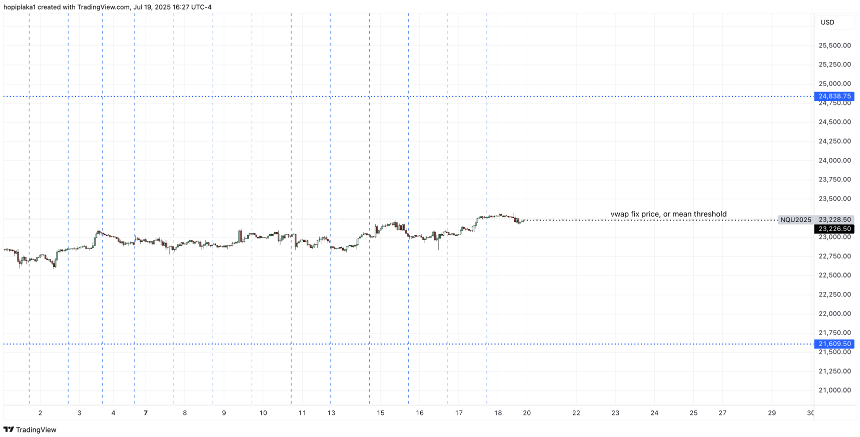
REFERENCE PRICE	7% PRICE LIMIT (OVERNIGHT HOURS) & 5:00 P.M. TO 8:30 A.M. UP AND DOWN	7% PRICE LIMIT DOWN ONLY	13% PRICE LIMIT DOWN ONLY	20% PRICE LIMIT DOWN ONLY
2322400	2483850 / 2160950	2160950	2022550	1861100

You can see the fix price is the same as the reference price.
Notice anything particular with these numbers? The H/L are nor exactly 7, 13 and 20? That’s strange, is that a bug you ponder?

No, there’s a level of calibration we need to do here, and that’s where Tesla vortex numbers come into play.
7 is actually 6.93 or vortex 9
13 is actually 12.6 or vortex 9
20 is actually 19.8 or vortex 9

But that’s just a side note.

Let’s try with the first 7% breaker price limits:



Wow, that’s a huge range. Impossible to create a trade plan out of this.
How can we fix this?
We know the concept of a dealing range. A dealing range has a high, a low and a middle. Lets’ use this to our advantage.
We have the high and low, the middle is the fix price, or 50% of the range.

Let’s play a bit with the numbers 7, 13 and 20. We will add and subtract them from the middle.

Ok, better but there’s a huge gap on top and at the bottom. No worries, let’s use our numbers and subtract them from the top, and add them from the bottom.

Now this looks like a nice range already, with tradable levels.

These are the values we used, which is basically 7, 13 and 20 added and subtracted from the middle, and from the high and low

And this is also where the sequence reveals itself.
The sequence is:

7-6-7-10-7-6-7

From 0 towards the first circuit breaker is 7
From 7 towards the next circuit breaker 13 is 6
From 13 towards the next circuit breaker 20 is 7

And there’s a gap of 10 when we start counting from the middle, with the same 7-6-7 pattern.

Hence the twin tower trade plan.
Binary 10 is 2 in decimal, and two 767’s flew in the north and south towers.

It's also good to know that the pd area matrix as defined by ict can also be used in this setup.
The gap of 10 when we have the 7-6-7 sequence from the middle and the h/l can be identified as liquidity void.
The equilibrium is where the e=mc2 is defined, all other pd area blocks can be define in the 7-6-7 sequence.

But wait hopi, you said C2, so we need to have a circuit breaker dealing range below and above the mean threshold.
No worries, we understand the sequence, so we build a 100% dealing range using the 7-6-7-10-7-6-7 sequence and apply it to above and below the mean threshold.
In order to do that, we just need to double the circuit breaker values:
7 -> 14
13 -> 26
20 -> 40
10 -> 20

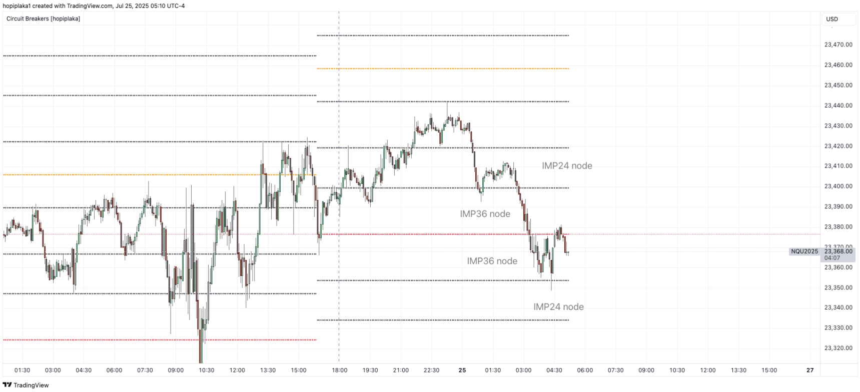
So 1 range (below in this case) will look like this

Or these fib values:

Notice something here?

From 50 -> 60 = 10
From 50 -> 74 = 24
From 50 -> 86 = 36

Can this be the IMP10, IMP24 and IMP36 nodes ict was referring to?



It must be a coincidence, no doubt.

And just like that, and with the cbdr/ar/flout teachings in mind, the largest range or IMP36 is the cbdr, the middle range or IMP24 is the AR and the smallest range or IMP10 is flout.

And they refer to the 3 circles that makes up ict logo.

I you are into candle counting, you will see this pattern too:
7-6-7-10-7-6-7

Or the 7th candle, the 13th candle and the 20th candle.
But there's a group big into this, so I will refer to them for the findings, but at least you now know where it really comes from (they use 21).

If you are into 90 minute dealing ranges, you can also see the pattern
But there we will just use the numbers, and add them together, and we will leave the gap as is

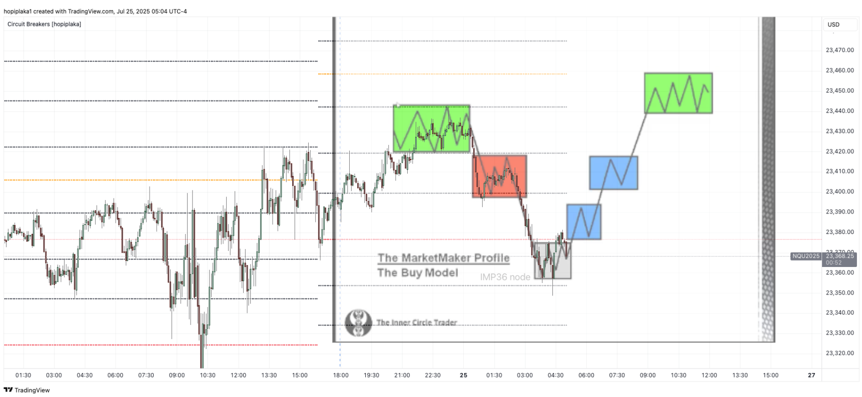
7 + 13 + 20 + 10 + 7 + 13 + 20 = 90 minutes.

Or 40 minutes, 10 min break, 40 minutes.
Again, there's others who are big on 90 min cycles, but at least now you understand how they fit in the grand scheme of things.

Some would note that the ranges are still very large, and sometimes don't offer a trade idea.

Enter **decimated circuit breakers**. Not the D of dynamic (read up on DCB on CME website), but **decimated**.
What this means is that we just take the circuit breaker, and divide it by 10. So we will get 0.7, 1.3 and 2.0% as circuit breakers.

Using the decimated circuit breakers, the IMP nodes that are made up by the 7-6-7-10-7-6-7 sequence, you can even automated MMxM models.



6.

TRADE PLAN

The trade plan is pretty straightforward. You now have the exact time point you're interested in, each and every day.
You than decide what circuit breaker to use. I really like the 3.5% for us indices instead of the 7, 13 or 20, as they get wide.

And of course, the decimated circuit breakers :)

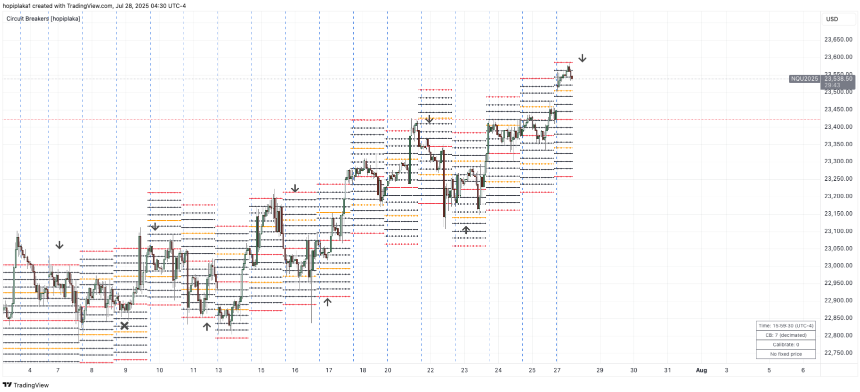
And you draw the 7-6-7-10-7-6-7 sequence in it.
Like ict explained, in between the levels there's a middle (or CE), these will also be nice reaction points.

In the above screenshot you can see how the levels are respected, I didn't draw the middle in between the levels tho.
As always, look for gaps or blocks around the levels (to the left of the chart)

At 09:30 market open, you look for a top run of the liquidity, block of gap at one of the circuit breaker levels (or the CE in between)

When you use the DCB, so the decimated circuit breakers, they can help you to determine the order flow, or the daily bias so to speak.
In below example I used the **decimated 7%** circuit breaker (so 0.7%).

Notice something interesting here? Can you see that almost every time, when they breached the top or bottom of the 0.7%, the bias switches the next day?
It rarely doesn't do it, although in the example you can see 1 occurrence (marked with X) where it didn't switch bias.



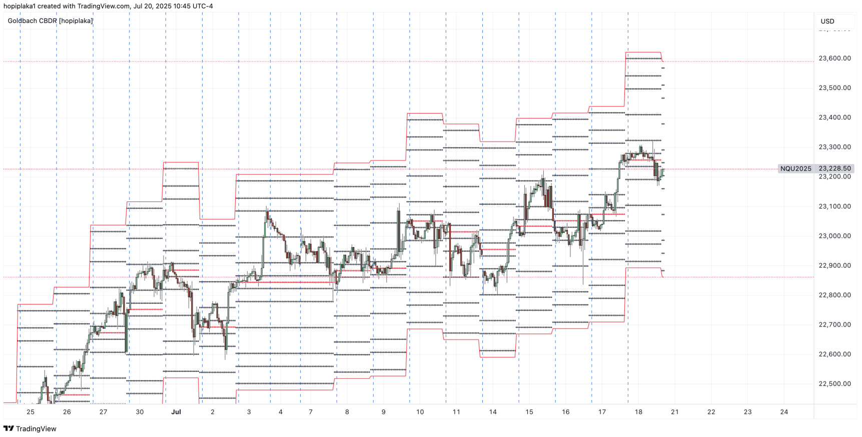
Most who downloaded this book know I'm a big van of fixed PO3 ranges, and Goldbach levels in between.
Until now I taught to use base 0 to start stacking the ranges. But you can use the daily fix level to anchor the PO3 range, and you have dynamic (but fixed po3) levels.

To me, it better display the e=mc2 part.
You don't draw a circuit breaker fib using the 7, 13, 20% range, but rather use a fixed po3 (729 here) with Goldbach levels, with the fix price, up and down.

It clearly shows:
The new **E**quilibrium = **M**ean **T**hreshold (the fix price, vwap based), and 2 fibs on both sides of the fix price.
The original consolidation will happen each day around the fix price, you than look for the expansion/retrace/reversal pattern as explained by ict.

Should you be interested in Goldbach ranges, I've made a Fast Track to get up to speed. It can be found here: https://hopiplaka.gumroad.com/l/goldbach_fasttrack

So I would use the Twin tower system to lay out the Intended Market Profile, and to see where a possible order flow change happens, and the Goldbach plan to highlight the internal and external liquidity.



5.

FURTHER INFO

I would advise you to read all the pages at the CME group. You will read on the trade engine that is responsible to deliver the price, but you will also find references to most pd areas of ict.

There is Price Banding (or **Propulsion Block**?)
https://cmegroupclientsite.atlassian.net/wiki/spaces/EPICSANDBOX/pages/457320464/GCC+Price+Banding

You will find info on **market makers**
https://cmegroupclientsite.atlassian.net/wiki/spaces/EPICSANDBOX/pages/457412603/Market+Makers

And the **liquidity providers**
https://www.cmegroup.com/markets/fx/fx-futures-and-options-block-and-efrp-providers.html

Indicative Open Price is also worth a read
https://www.cmegroup.com/education/indicative-opening-price-overview.html

Maybe you are interested in **order blocks**?
https://www.cmegroup.com/education/articles-and-reports/fx-futures-and-option-block-reference-guide.html#1

Or maybe how to calculate **fair value**?
https://www.cmegroup.com/trading/equity-index/fairvalue.html

Interested in how **mitigation** works?
https://www.cmegroup.com/education/videos/in-flight-mitigation-on-cme-globex-video.html

Or how to **void** something?
https://www.cmegroup.com/tools-information/webhelp/cme-clearport/Content/void-transaction.html

6.

THANK YOU

Thank you for reading this booklet on my vision on where ict stands for, and where he got his information from.

Again, this info is not verified by Michael J Huddleston, and is just my interpretation of it. It might be pure fiction, or not, but I loved how the puzzle was fitting here.

Although this seems like a very nice trading system, I still trade Goldbach levels with fixed PO3 dealing ranges.
But I like the confluences this trading system gives the identify potential highs and lows for a given day.

I hope you enjoyed reading it, and triggers your quest for more information. I would suggest to browse through the cme group website, it contains a wealth of information.

Hopi
